C&C Anaesthetic Crisis Handbook

DIAGNOSING

For every problem:

- Never normalise the abnormal
- Verbalise the problem. Say out loud....

'We have a problem, I am concerned'

- Call for help
- Set oxygen to 100% (except where stated otherwise)
- Use indexed pages to facilitate diagnosis:
 - Frequency gamble common causes
 - Use a structured approach to consider all causes
- Seek to actively prove / disprove all possible causes

www.AnaestheticCrisisHandbook.com
(Created by Adam Hollingworth with help from many people along the way) (C&C version localised by Hannah Janssens & Eilidh Menzies)
Adapted from various sources including:

Guidelines: ANZAAG, AAGBI, NZRC, Starship Protocols
vortexapproach.org. Dr Chrimes & Dr Fritz
Hutt Valley & CCDHB: Clinical protocols
ESA Emergency Quick Reference Guide
CCDHB Crisis Checklists. Dr A McKenzie
Emergencies in Anaesthesia. Oxford Handbook

Various published peer reviewed papers

Flip end over end for Treating known EMERGENCIES

Instructions for Use

- Use the index and coloured tabs to find quick reference pages to assist in a crisis.
- The handbook is in 2 parts:
 - The front book: How to treat known Emergencies
 - The back book: How to Diagnose Problems
- Routine/obvious tasks (eg call for help, turn oxygen to 100%) are assumed & thus not repeated on every sheet for clarity
- For simplicity & to avoid calculation errors in an emergency, drug doses are given for a 70 kg adult. Paeds doses are clearly marked with .
 (where appropriate).
- There is an adult & paediatric drug formulary at the back
- Cards are arranged into coloured boxes:
 - Emergency/Doing tasks
 - Thinking tasks, diagnostic or further information
 - Doses, equipment or calculation information
- Work through emergency/doing boxes in a linear fashion. Decision making steps are highlighted for clarity.

Using an aid such as this efficiently, in a crisis, is a **learned** skill. You must take time to become **familiar** with this manual and **practise** using it.

It is recommended that a '**reader**', with no other tasks, **read these cards out loud** to the team leader during the crisis.

25d. HIGH AIRWAY PRESSURE

- □ **Listen to** chest. Watch for bilateral chest rise & fall
- Switch to **bag** manually ventilate to confirm high pressure
- Examine **EtCO**₂ waveform ?bronchospasm ?kinked ETT
- Exclude light anaesthesia & inadequate muscle relaxation
- Perform a systematic visual check:
 - airway device (position or kinking) \Rightarrow filter \Rightarrow circuit \Rightarrow valves \Rightarrow ventilator
- Check airway patent: suction full length of ETT or bronchoscopic exam
- ☐ If suspect **autoPEEP** watch for persistent expiratory flow at end expiration. Try disconnecting circuit.
- ☐ If problem **not identified** :
 - Exclude circuit: replace circuit with Ambu-bag (if required convert to TIVA)
 - Exclude filter: replace or remove
 - Exclude airway: replace ETT. If using LMA convert to ETT
 - Not resolved = patient problem
- Consider timing of event eg CVL insertion, position change, surgical event
- Possible causes (most common in bold):
 - Circuit:
 - ventilator settings
 - kinked tube
 - valve failures
 - obstructed filter
 - O₂ flush failure
 - Airway:
 - laryngospasm
 - tube position
 - tube size
 - blocked or kinked tube

- Patient:
 - bronchospasm
 - chest wall rigidity
 - anaphylaxis
 - pneumoperitoneum

 - alveolar problems/pathology:

 - infections
 - ARDS
 - contusion
 - tracheal problems/pathology :
 - FB
 - secretions
 - tumour

- pneumothorax
- obesity
- - oedema

26d. LOW SpO₂

- □ Check FiO₂ & turn to 100% O₂
- Check patient colour, peripheral temperature & probe position
- Switch to bag to test circuit integrity & lung compliance
- □ Check the SpO₂ & EtCO₂ waveforms to aid systematic diagnosis:
 - If EtCO₂ waveform abnormal or absent:
 - Exclude: disconnected circuit, cardiac arrest, 1 cardiac output
 - Consider laryngospasm or bronchospasm (if LMA convert to ETT)
 - Check airway position & patency:
 - Visualise cords = rule out **oesophageal intubation**
 - Look inside mouth for kinks/gastric contents
 - Suction full length of ETT or bronchoscopic exam
 - Check ventilator mode & setting
 - Ventilate via Ambu-bag to exclude ventilator/circuit/probe problem
 - If EtCO₂ waveform normal: (.: intact circuit integrity):
 - Check fresh gas flow / FiO2
 - Exclude endobronchial ETT
 - Exclude pneumothorax: Neck veins, chest rise, auscultate or ultrasound
- Work through diagnostic checklist below to exclude all other causes
- · Consider timing of event eg position change, surgical event
- Possible causes (most common in bold):
 - Airway:
 - airway obstruction
 - laryngospasm
 - bronchospasm
 - endobronchial intubation
 - oesophageal intubation
 - aspiration
 - Ventilator/Circuit/Probe:
 - probe displacement
 - inadequate reversal
 - mal: function/setting
 - auto-PEEP
 - low fresh gas flow
 - oxygen supply failure
 - circuit obstruction/ disconnection

- Lungs/Breathing:
 - apnoea/hypoventilation
 - atelectasis
 - pneumothorax
 - pulmonary oedema acute or negative pressure
 - sepsis/ARDS
 - contusion
 - pneumonia
 - interstitial lung disease
- Circulation:
 - cardiac arrest
 - heart failure
 - anaphylaxis
 - embolism: pulmonary, air, CO2, cement
 - hypothermia/poor peripheral circulation
 - methaemoglobinaemia e.g. prilocaine

25d

26d

27d	27d. HIGH EtCO ₂
	Quick check patient monitors: ?oxygenated & anaesthetised patient:
28d	Anaesthetist's A Airway , B SpO2 Vent Settings , C HR MAP , D Depth of anaesthesia , E Temp
	This is generally not a crisis. Use the time to consider the causes
	Frequency gamble:
	 Check monitors & ventilator:
	- EtCO ₂ waveform
	- Fresh Gas Flow - correct for circuit type, size of patient
	- Ventilator settings & mode - Resp rate, Tidal volume
	 Check soda lime ?exhausted
	► Review:
	- Anaesthetic depth
	- Recent drug doses for errors
	Systematically work through all causes (see below)

- Consider timing of event eg drug administration, surgical event
- Possible causes (most common in bold):

†*Production*

- Endogenous:
 - sepsis/îtemp
 - MH
 - thyroid storm
 - malignant neuroleptic syndrome
 - reperfusion
- Exogenous:
 - CO₂ insufflation
 - bicarb administration

↓Elimination

- Lungs:
 - hypoventilation
 - bronchospasm/asthma
 - COPD
- Circuit/machine:
 - ↓Fresh Gas Flow/re-breathing
 - incorrect vent settings
 - soda lime exhaustion
 - airway obstruction
 - 1 dead space
 - valve malfunction

28d. LOW EtCO₂

- □ Quick check patient monitors: ?oxygenated & anaesthetised patient:
 - ► Anaesthetist's A Airway B SpO₂ Vent Settings , C HR MAP , D Depth of anaesthesia , E Temp

□ If **no EtCO**₂ waveform diagnose immediately:

- Incorrect ETT placement: "No Trace, Wrong Place". If in doubt, replace
- Severe bronchospasm confirm airway tab 4e
- Check circuit & EtCO₂ sample line connections

□ If low EtCO₂ then first frequency gamble:

- Cardiac or peri-arrest?: tab 6e or tab 7e
- Check sampling line securely connected & patent
- Examine patient:
 - Airway position & patency
 - Auscultate & ensure bilateral chest rise (r/o laryngospasm/bronchospasm)
- Check ventilator:
 - Switched on & functioning
 - Correct settings: tidal volume, RR

If problem not identified work through causes systematically (see yellow box)

- · Consider timing of event e.g. post intubation, drug administration, surgical event
- "No Trace, Wrong Place". Even in cardiac arrest without CPR; EtCO2 should still be recordable
- If not an emergency or urgent, correlate EtCO₂ with ABG and PaCO₂
- Possible causes (most common in bold):

NO EtCO₂!!:

- oesophageal intubation
- no ventilation, no airway
- cardiac arrest
- circuit/sampling line disconnection
- ventilator failure or not on
- apnoea
- Production:
 - hypothermia
 - deep anaesthesia
 - ↓thyroid
- Sampling dilution:
 - high FGF
 - sampler placed incorrectly
 - dilution of sampling gas with air
 - circuit disconnected

- tElimination:
 - hyperventilation
- ↓Transport of CO₂ in blood:
 - severe hypotension/low CO state
 - anaphylaxis
 - cardiac arrest
 - embolism air or pulmonary
 - tamponade/tension pneumothorax
- $\downarrow CO_2$ diffusion in lung:
 - low tidal volumes/dead space
 - laryngospasm
 - severe bronchospasm
 - ETT obstruction
 - endobronchial intubation

28d

• *Magnesium*: [torsades] 10mmol (5ml of 49.3%) over 2min (...= 0.1ml/kg). (Give slower for other causes)

30d. BRADYCARDIA

- Quick check patient monitors: is the patient oxygenated & anaesthetised?: D Depth of anaesthesia, E Temp ► Anaesthetist's A Airway, B SpO₂ C HR MAP, If MAP >65mmHg you have time (see causes in yellow box) \Box If **MAP** <65mmHg +/- with evidence of \downarrow perfusion then consider: Atropine 600mcg upto 3mg (... = 20mcg/kg) Glycopyrrolate 200mcg upto 1mg (... = 10mcg/kg) Ephedrine 9mg bolus titrated (= 0.1 mg/kg) Adrenaline infusion (tab 36r) Isoprenaline infusion (... (tab 36r)) Dopamine infusion (tab 36r) If drug toxicity or overdose: **29**d Bblocker = as above + high dose insulin infusion, Na bicarb (if propanolol OD) Ca channel = as Bblocker + 10ml 10% Ca chloride slow push (can repeat) **30**d □ If severe refractory bradycardia try external temporary pacing: attach defib & ECG leads 1 mA of output until capture (normally 65-100mA required) set to PACER mode set final mA 10mA above capture select rate 60/min confirm pulse [] If PEA at any point start CPR tab 7e tab 8e Consider timing of event eg drug administration, surgical event Possible causes (most common in **bold**): Primary causes: Secondary causes: Anaesthetic causes: - vagal stimulation - vasopressors - athlete - volatile - **drugs** eg error, overdose, - IHD anti-arrhythmics - suxamethonium - AV block - electrolyte abnormality - pacemaker malfunction - opioids - ↓thyroid - cardiomyopathy high/total spinal - sick sinus syndrome - *itemperature* - anticholinesterases
 - hypoxia
 - auto-PEEP
 - MH
 - 1↓K+

- myocarditis
- pericarditis
- valvular heart disease
- pulmonary HTN
- For paediatric normal heart rates: tab 9e
- Isoprenaline: Dilute 1mg (5vials) into 50ml. Infuse at 0-60ml/hr
- Adrenaline: 5mg in 50ml saline. Infuse at 0-20ml/hr
- Dopamine: 100mg in 50ml saline. Infuse at 0-20ml/hr
- Na bicarb 8.4% [β blocker OD]: 50ml slow push. Can repeat every 2min (target pH 7.45-7.55)

- TICP

- cardiac tamponade

- tension pneumothorax

• High dose insulin [B blocker/CCB OD]: Bolus= 50ml of 50% dextrose & 70u actrapid. Infusion= 100u actrapid in 50ml saline, run at 35ml/hr and 10% dex run at 250ml/hr (monitor BSL & K every 30mins)

31d. HYPERTENSION

- □ Quick check patient monitors: is the patient oxygenated & anaesthetised?:
 - ► Anaesthetist's A Airway B SpO2 Vent Settings, C HR MAP, D Depth of anaesthesia, E Temp
- Check accuracy of reading: check equipment (including transducer height)
- □ Frequency gamble on **common** causes:
 - Check for painful surgical activity give analgesia
 - Check recent drug infusions & recent doses for drug error (incl. LA with adrenaline)
 - Check tourniquet time
 - Consider bladder volume/fluids infused
- Systematically work through possible causes (see yellow box)
- Once all reversible causes have been addressed then consider
 IV antihypertensive agents (as green box below) to SBP target of ~160mmHg
- Consider timing of event eg drug administration, surgical event
 - Possible causes (most common in bold):
 - Anaesthesia:
 - too light
 - pain

31d

32d

- drugs consider error
- hypoxia
- hypercapnia
- MH
- IV line non-patent/tissued
- A line transducer height
- Surgery:
 - pneumoperitoneum
 - tourniquet
 - aortic clamping
 - carotid endarectomy
 - baroreceptor stimulation
- *B Blocker* = **esmolol**: 10mg boluses titrated; **metoprolol**: 2.5mg boluses titrated (max 15mg)
- a Blocker = labetalol (also ß blocker): 5mg boluses titrated (max 100mg). phentolamine: 5-10mg IV repeated every 5-15mins
- a Agonists = clonidine: 30mcg boluses titrated (max 150mcg)
- vasodilators = GTN: S/L spray or IV infusion: 50mg in 50ml saline at 3ml/hr and titrate;
 magnesium: slow bolus 5ml of 49.3%, repeat if required

- Patient related:
 - essential HTN
 - rebound HTN B blocker stopped
 - full bladder
 - pre-eclampsia
 - renal disease
 - phaeochromocytoma (always give a blocker before ß blocker)
 - thyroid storm
 - TICP

32d. HYPOTENSION

- □ Check patient monitors: is the patient oxygenated & anaesthetised?:
 - ► Anaesthetist's A Airway B SpO₂ Vent Settings , C MAP , D Depth of anaesthesia , E Temp

Check accuracy of reading: check equipment (including transducer height)

- □ Assess **severity**: visualise patient, check ECG & EtCO₂/SpO₂ waveform:
 - No cardiac output or critical MAP: start CPR: tab 6e or tab 7e
 - MAP <65mmHg & concern then consider:</p>
 - Leg elevation
 - Rapid infusion of fluid +/- ready to transfuse blood tab 12e
 - IV vasopressors or inotropes
- Consider reversible causes:
 - Frequency gamble on common causes
 - Systematically consider each cause in turn
- Consider:
 - ECHO (if skilled) to help differentiate causes
 - Other invasive monitoring to assist with diagnosis e.g. PPV SVV from arterial line, cardiac index monitoring
- Consider timing of event e.g. drug administration, surgical event, scope surgery (always suspect concealed haemorrhage)
- Possible causes (most common in bold):
 - ► ↓*Preload*:
 - blood loss/hypovolaemia
 - 1 intrathoracic pressure
 - VR eg IVC compression, pt position, pneumoperitoneum
 - tamponade/tension pneumothorax
 - embolism
 - Contractility:
 - drugs incl. volatiles
 - IHD
 - cardiomyopathy
 - myocarditis
 - arrhythmia
 - valvular heart disease

- Afterload:
 - **drugs** eg vasodilators incl **anaesthetic agents**, **opioids**, antiHTN drugs
 - neuraxial techniques
 - sepsis
 - tourniquet or clamp release
 - anaphylaxis
 - addisons crisis
 - ↓thyroid
- Equipment/human:
 - artefact or failure
 - Invasive: wrong transducer height
 - NIBP: wrong cuff size
 - drug error
- ECHO: Consider LVEDV, LV function, gross valvular abnormality
- PPV SVV: >12% (only if: intubated, paralysed, Vt >8ml/kg, in sinus rhythm, norm abdo pressure) suggests hypovolaemia
- Normal CI = >2.6 L/min/m²
- Pressors: metaraminol 0.5mg (
 10mcg/kg); phenylepherine 100mcg, ephedrine 9mg (
 0.25mg/kg), adrenaline 10-50mcg
- noradrenaline/adrenaline infusion: 5mg in 50ml. infuse 0-20ml/hr

- 31d
- **32**d

^{• [}suxamethonium apnoea]: No reversal option ⇒ continue anaesthesia/refer to ICU

eaj: No reversal option \Rightarrow continue anaestnesia/refer to ICU

35r. ADULT DRUG FORMULARY

Drug	Bolus	Infusion
Adenosine	6mg, then 12mg, then 12mg.	-
Adrenaline (1:1,000 = 1mg/ml) (1:10,000 = 100mcg/ml)	[Arrest] 10ml of 1:10,000 (1mg) [Other] 0.1ml - 1ml of 1:10,000 (10-100mcg). Titrate	5mg in 50ml saline. Infuse 0-20ml/hr
Alteplase	[Cardiac arrest] 50mg slow push. Can rpt at 15min [Peri-arrest] 20mg slow push	[Peri-arrest] 80mg in 20ml saline. Infuse at 10ml/hr
Aminophylline	400mg over 15mins	50mg in 50ml at 35ml/hr
Amiodarone	300mg slow push	900mg in 500ml D5W over 24hours
Ca ²⁺ Chloride (10%)	10ml slow push	-
Clonidine	30mcg. Titrate (max 150mcg)	-
Dobutamine	-	250mg in 50ml saline. Infuse 0-10ml/hr
Esmolol	10mg. Titrate	-
GTN	[tocolytic] 100-250mcg	[ischaemia] 50mg in 50ml saline. Infuse 3-12ml/hr. Titrate to MAP/ECG
Hydralazine	Dilute to 1mg/ml. Give 5ml slow push. Repeat every 20min (max 30ml)	Dilute to 1mg/ml. Start infusion at 5ml/hr. Change rate by 1ml/hr every 20mins (max 20ml/hr)
Hydrocortisone	200mg	
Insulin (actrapid)	[ßblocker or CCB OD] 50ml of 50% dextrose & 70u actrapid (1u/kg). Give as bolus.	[[†] K ⁺] 10units in 250ml 10% dextrose. Infuse quickly [ßblocker or CCB OD] 100u actrapid in 50ml saline, run at 35ml/hr and 10% dextrose run at 250ml/hr. check BSL & k /30min
Intralipid (20%)	100ml bolus (1.5ml/kg), Rpt every 5min, max x2	1000ml/hr (15ml/kg/hr). Can double rate @5mins (max total dose = 12ml/kg)
Isoprenaline	200mcg into 20ml saline. Give 1ml boluses titrated	1mg into 50ml saline. Infuse at 0-60ml/hr
Ketamine	[induction] 70-140mg (1-2mg/kg) [bronchospasm] 35-70mg (0.5-1mg/kg)	-
Labetalol	5-20mg slow push. Titrate (max 100mg)	[eclampsia]: Add 100mg to saline to make 100ml volume. Infuse at 20ml/hr. Double rate every 30mins (max 160ml/hr)
Lignocaine (1%) (1ml = 10mg)	[Arrhythmia] 7ml (0.1ml/kg). Can rpt every 10mins (max 0.3ml/kg)	Neat 1% at 6-24ml/hr. (Total max in 1hr = 30ml ie 3mg/kg)
Magnesium (49.3%) (1ml = 2mmol = 0.5g)	[bronchospasm] 5mls over 20min [torsades] 5ml slow push [eclampsia] 8ml in 12ml saline. Infuse at 120ml/hr	[eclampsia]: Maintenance = add 16ml to 100ml saline. Infuse at 14.5ml/hr Rescue (another seizure). 4mls in 6ml saline. Push over 5min
Metaraminol	0.5-1mg. Titrate	10mg in 20ml saline. Infuse 0-40ml/hr
Metoprolol	1-2.5mg. Titrate (max 15mg)	-
Midazolam	[seizures] 1-7mg. Titrate	-
Milrinone	-	10mg in 50ml saline. Infuse at 5ml/hr or 10ml/hr only
Naloxone	[emergency] 400mcg [titration] 40mcg (max 800mcg)	Infusion with hourly rate = 2/3 of bolus dose required for initial clinical effect
Noradrenaline	-	5mg in 50ml saline. Infuse 0-20ml/hr
Oxytocin	[elective] 3units slow bolus (do not repeat) [emergency] 5units slow bolus (do not repeat)	40units in 1000ml saline. Infuse 250ml/hr
Phentolamine	5-10mg. Repeat every 5-15 mins as required	-
Phenylepherine	100mcg bolus. Titrate	10mg in 100ml saline (100mcg/ml). Infuse 0-40ml/hr
Salbutamol	250mcg slow push (Inhaled: 12 puffs via circuit)	5mg in 50ml saline. Infuse 0-10ml/hr
Sodium Bicarb (8.4%)	25-50ml slow push. Can repeat every 2mins (target pH 7.45-7.55)	-
Sugammadex	[emergency post intubation] = 16mg/kg; [PTC>2] 4mg/kg; [>T₂]= 2mg/kg	
Suxamethonium	[laryngospasm] 35mg (0.5mg/kg)	
Tranexamic Acid	1g over 10mins (15mg/kg)	1g in 100ml saline. Infuse at 12.5ml/hr (8hrs)
Vasopressin	1unit slow push	20units in 20ml saline. Infuse 1-4ml/hr

36r

36r. PAEDIATRIC DRUG FORMULARY

Drug	Bolus	Infusion
Adenosine	0.1mg/kg, then 0.2mg/kg, then 0.3mg/kg	-
Adrenaline (1:1,000 = 1mg/ml) (1:10,000 = 100mcg/ml)	[Arrest IV] 0.1ml/kg 1:10,000 (10mcg/kg) [Arrest ETT] 0.1ml/kg of 1:1,000 (100mcg/kg) [Other] 0.01-0.05ml/kg 1:10,000 (1-5mcg/kg) [IM dose] 0.01ml/kg of 1:1,000 (10mcg/kg)	[↓bp] 0.15mg/kg (max 5mg) in 50ml saline. Infuse 0.5-10ml/hr
Aminophylline (25mg/ml)	10mg/kg (max 500mg) over 1hr diluted to 50ml with saline	1-9yrs: 55mg/kg made to 50ml with 5% dex. infuse 1ml/hr 10-15yr & <35kg: 35mg made to 50ml with 5% dex. infuse 1ml/hr 10-15yr & >35kg: neat drug. infuse 0.028ml/kg/hr
Amiodarone	5mg/kg slow push (max 300mg)	-
Atropine	20mcg/kg	-
Ca ²⁺ Chloride (10%)	0.05 - 0.2ml/kg (max 10ml) slow push	-
Dobutamine	-	15mg/kg in 50ml saline. infuse 0.5-4ml/hr
Ephedrine	0.25mg/kg (max 9mg/dose)	-
Esmolol	500mcg/kg slow push. Titrate	-
Glycopyrrolate	10mcg/kg	-
Hydrocortisone	[asthma] 4mg/kg	•
Insulin (actrapid)	[†K] Periph IV: 0.1unit/kg in 5ml/kg 10% dex [†K] CVL: 0.1u/kg in 2ml/kg 50% dex	-
Intralipid (20%)	1.5ml/kg bolus. Repeat every 5min, max x2	15ml/kg/hr. Can double rate @5min (max total dose=12ml/kg)
Isoprenaline	-	300mcg/kg in 50ml saline. Infuse at 1ml/hr (0.1mcg/kg/min) and titrate up (max 10ml/hr)
Ketamine	[bronchospasm & anaesthetised] 0.5-2mg/kg	-
Labetalol	0.25-0.5mg/kg slow push. rpt ev. 10min as req'ed	50mg/kg & saline to make 50ml. Infuse 0-3ml/hr (0-3mg/kg/hr)
Lignocaine 1%	[arrhythmia] 0.1ml/kg. Can rpt every 10mins (max 0.3ml/kg)	-
Magnesium (49.3%) (1ml = 2mmol = 0.5g)	[asthma] 0.1ml/kg (max 5ml) in 50ml saline over 20mins	-
Metaraminol	10mcg/kg	
Metoprolol	0.1mg over 5mins	-
Midazolam	[seizures] IV: 0.1mg/kg; IM 0.2mg/kg; buccal 0.5mg/kg. Can repeat dose @ 5mins	-
Naloxone	[emergency] 10mcg/kg (max 400mcg) [titrate] 2mcg/kg (400mcg in 20ml give 0.1ml/kg)	300mcg/kg to 30ml 5% dex & run at 0-1ml/hr (10mcg/kg/hr)
Noradrenaline	-	0.15mg/kg (max 5mg) in 50ml saline. Infuse 0.5-10ml/hr
Phenylepherine	2-10mcg/kg. Titrate	10mg in 100ml saline. Infuse 0-20ml/hr (1-5mcg/kg/min)
Salbutamol	Inhaled: <5yr=6puffs; >5yrs 12puffs via circuit IV: 10mcg/kg over 2 min (max 500mcg). Rpt @10min	Infuse 5-10mcg/kg/min for 1 hour, then reduced to 1-2mcg/kg/min. <16kg: 3mg/kg made to 50ml with 5%dex. Then 1ml/hr = 1mcg/kg/min; >16kg: Use 20ml of 1mg/ml solution. Then ml/hr = 0.06 x kg x dose (mcg/kg/min) See <u>Starship clinical guidelines for infusion chart</u>)
Sodium Bicarb (8.4%)	1ml/kg over 5min. Can repeat every 2mins (target pH 7.45-7.55)	-
Sugammadex	[emergency post intubation] = 16mg/kg; [PTC>2] 4mg/kg; [>T ₂]= 2mg/kg	-
Suxamethonium	[intubation] IV: 2mg/kg; IM 4mg/kg [non-emergency laryngospasm] 0.5mg/kg	-
Tranexamic Acid	15mg/kg diluted in 20-50ml saline over 10min. (Max 1g)	2mg/kg/hr in 500ml saline for 8hrs
Vasopressin	-	1unit/kg in 50ml saline. Infuse 1-3ml/hr

C&C Anaesthetic Crisis Handbook

www.AnaestheticCrisisHandbook.com

By Adam Hollingworth adamhollingworth@icloud.com

For Nichola. Thank you for your never-ending support and patience.

Second addition special thanks to Dr M Ku for your learned ideas and feedback.

Many other thanks to excellent colleagues who contributed to this manual. Without their suggestions, improvements, fact & error checking & so on, it wouldn't have been possible.

This includes (but not limited to): CCDHB QA Committee, Dr D Borshoff, Dr H Janssens, Dr J Cameron, Dr H Truong, Dr S Treshina, Mr R Pryer, Mrs J Dennison, Dr D Mein, Dr N Chadderton, Dr L Kwan, Dr A Haq, Dr S McRitchie, Miss L Anderson, Dr D Heys, Miss D Hantom, Mr D Livesey, Dr J Dieterle, Dr V Singh, Dr P Tobin, Dr B Waldron, Dr J McKean, Miss K Chadwick-Smith & many more.

DIAGNOSING

Version 3.3, Feb 2023

Disclaimer: Every effort has been taken to prevent errors/omissions/mistakes. However, this cannot be guaranteed. Graded assertiveness to query team leader decisions/management steps which are contrary to this manual are encouraged. However, clinical experience & acumen are vital in complex situations such as crises and may be more appropriate than this handbook in certain situations.
